AGRISCAN+ USER MANUAL

A CNN-Powered, Mobile-Responsive Web Decision-Support System for Early Rice Leaf Disease Detection and Yield Prediction

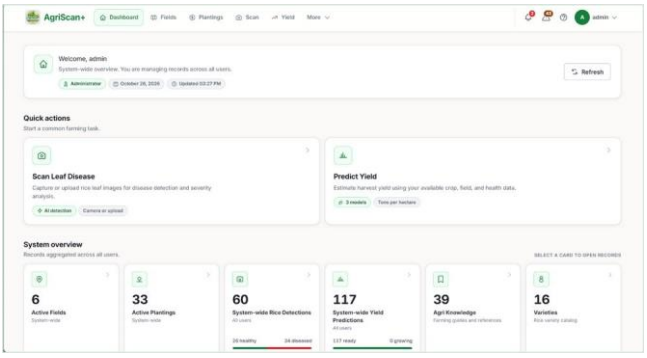

For the Department of Agriculture – San Teodoro

A step-by-step visual reference for account access, farm records, rice-leaf disease scanning, yield prediction, reports, and administration. Menus and available actions depend on your role.

INSIDE THE SYSTEM

DASHBOARD

DISEASE DETECTION

RECOMMENDED WORKFLOW

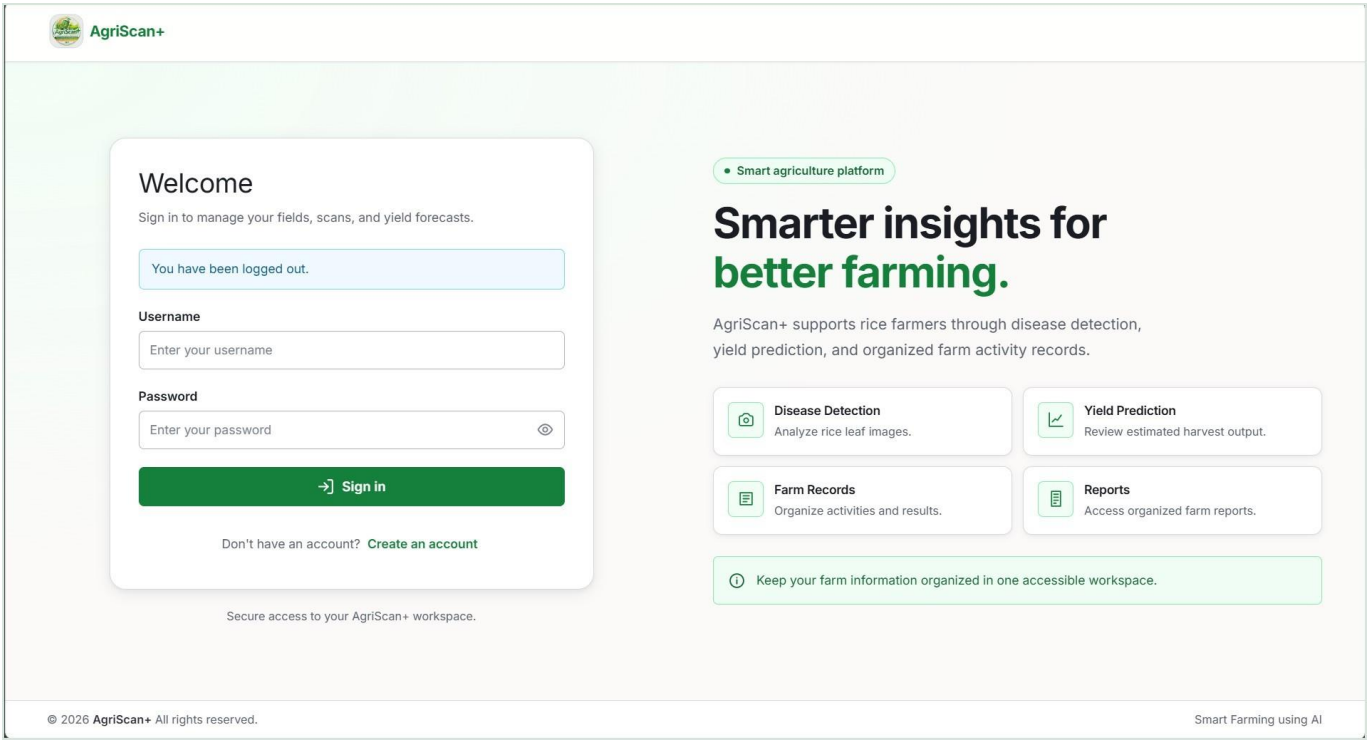

1. Create a Field 2. Add a Planting 3. Scan or Predict Yield 4. Record the actual Harvest

01 / GETTING STARTED

Account Access

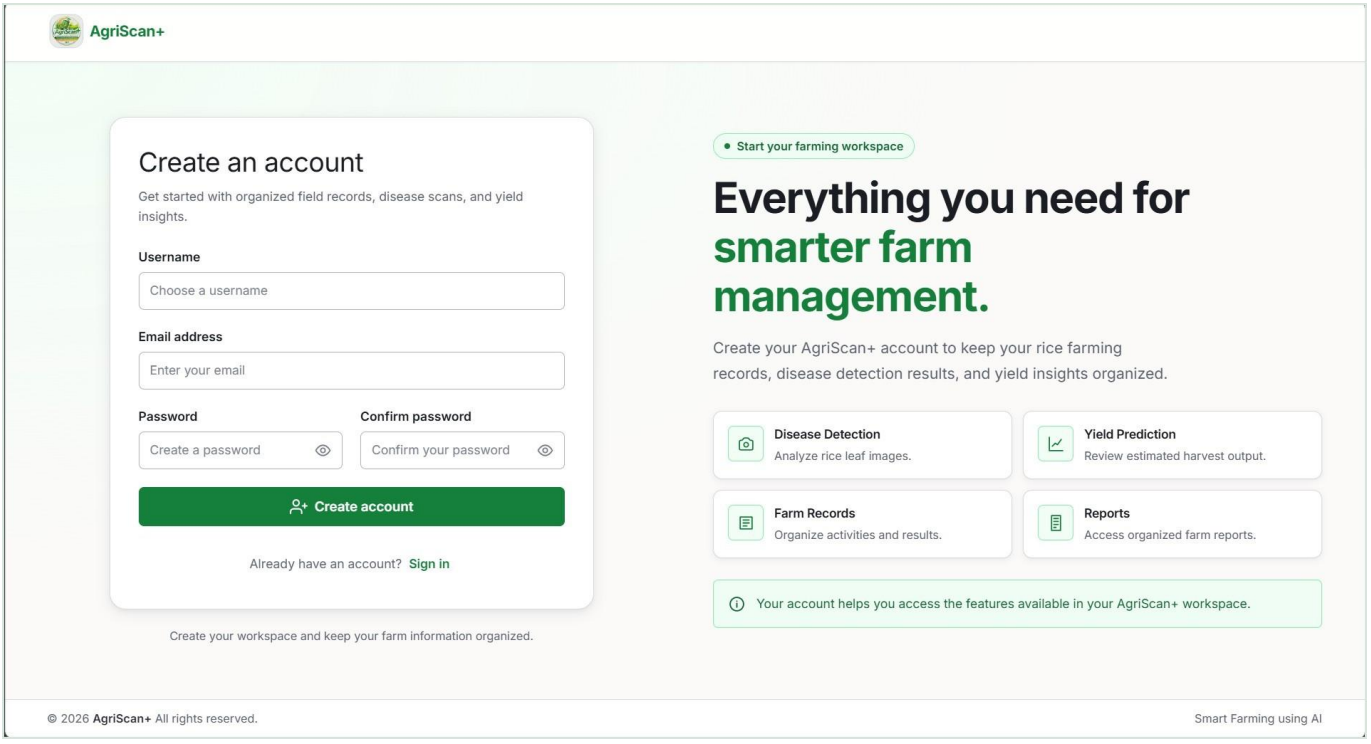

LOGIN Login Page

Sign in with your registered username and password. Full access is available after the account is active and approved.

REGISTER Register Page

Enter the required account details and submit. New accounts start as Farmer and may need admin approval before full access.

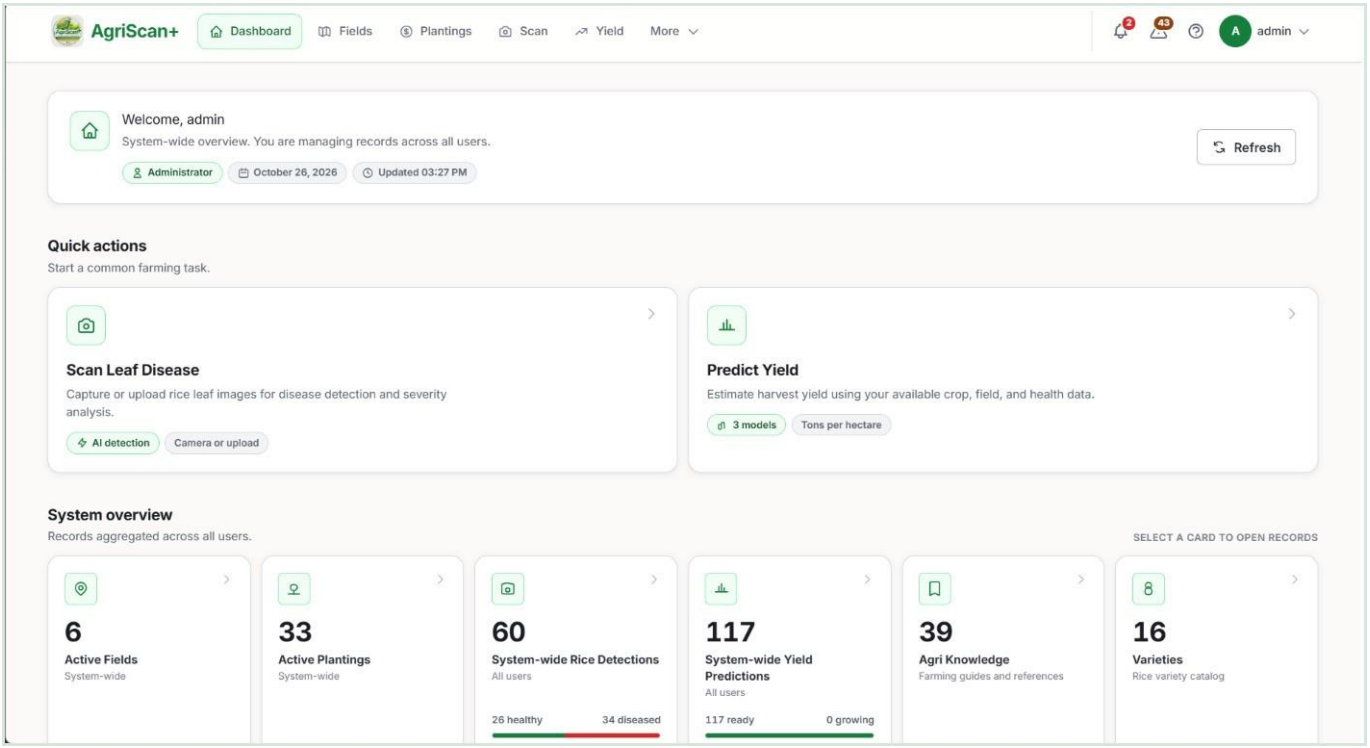

02 / OVERVIEW

Dashboard Overview

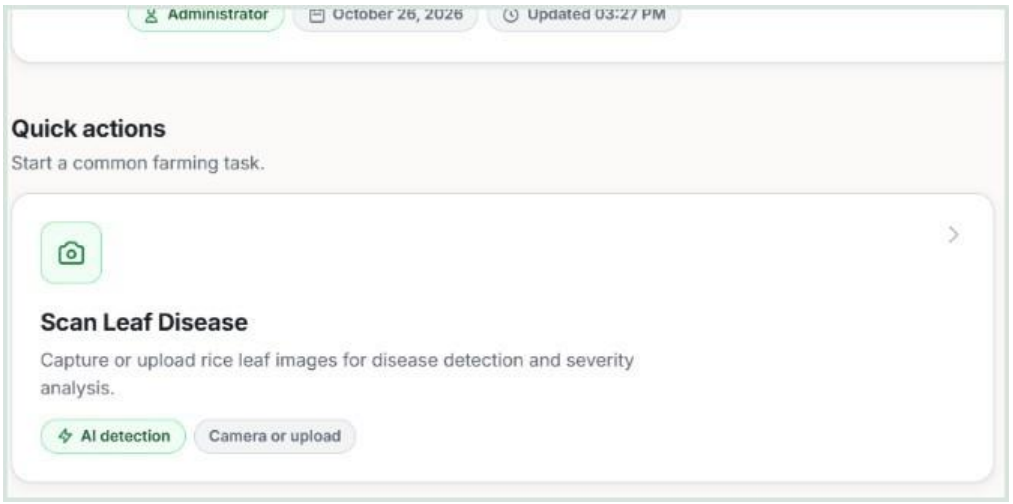

01 Dashboard

Review recent activity, notifications, key farm summaries, and system information such as model version and last scan.

DETAIL Dashboard: Quick Actions

Use the quick-action card to open the disease scanner. Yield Prediction is also available from the navigation menu.

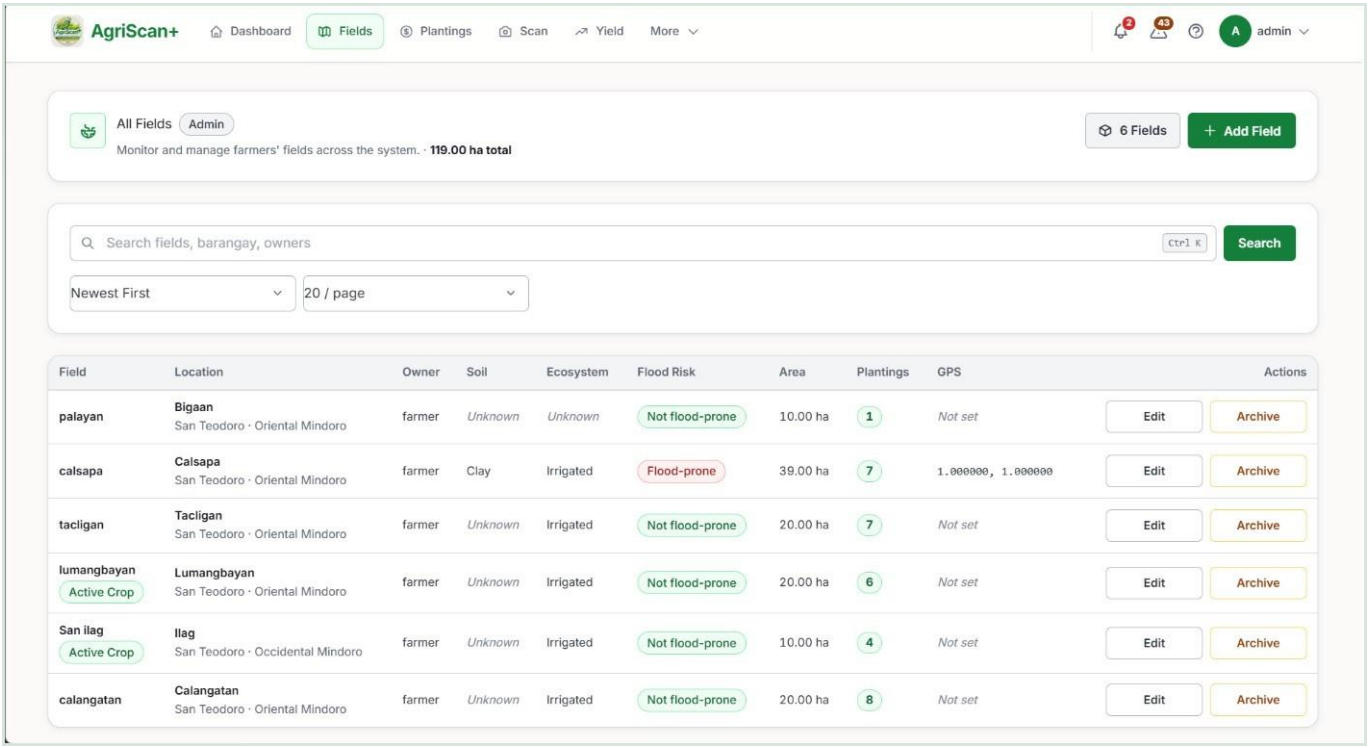

03 / FARM SETUP

Fields & Planting

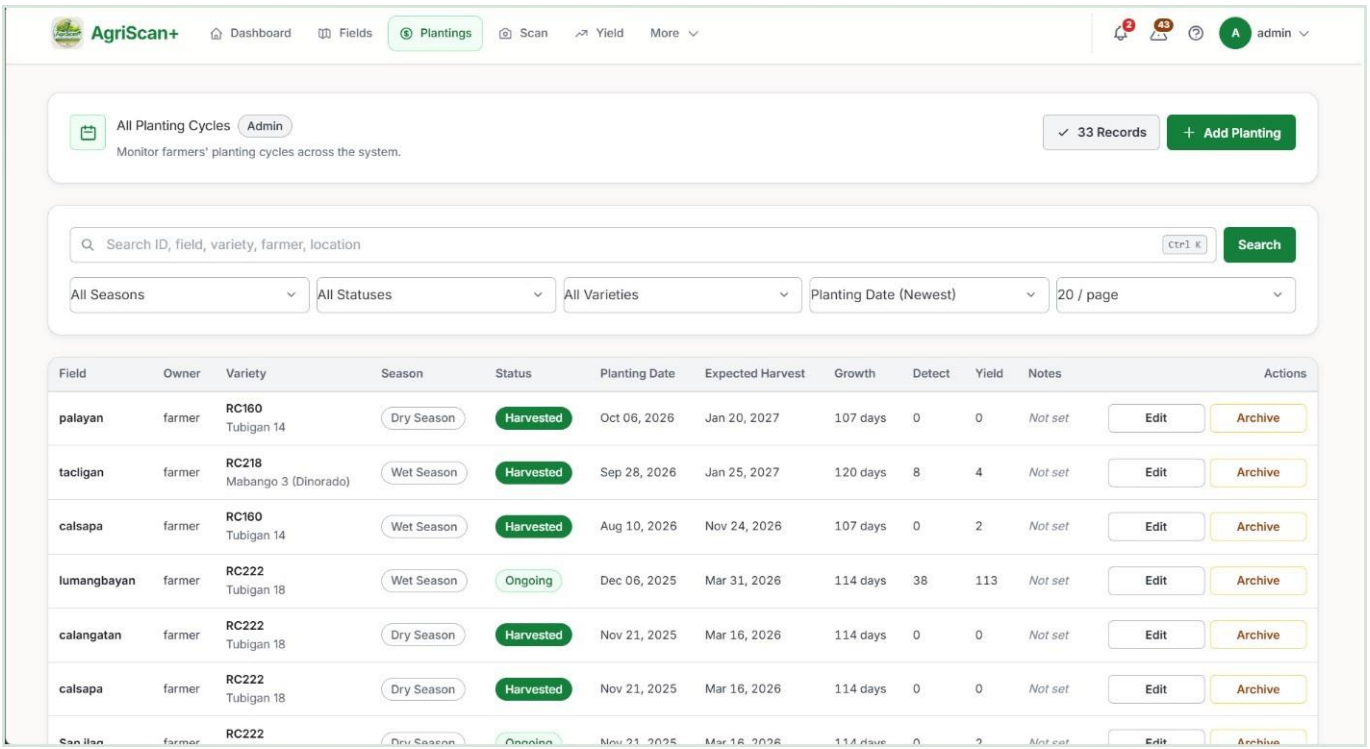

02 Fields Management

Create a field with its name, area in hectares, barangay, and location notes before adding a planting record.

03 Planting Cycles

Choose the field and rice variety, enter the planting date and season, then save the planting cycle before scanning.

RECOMMENDED WORK ORDER

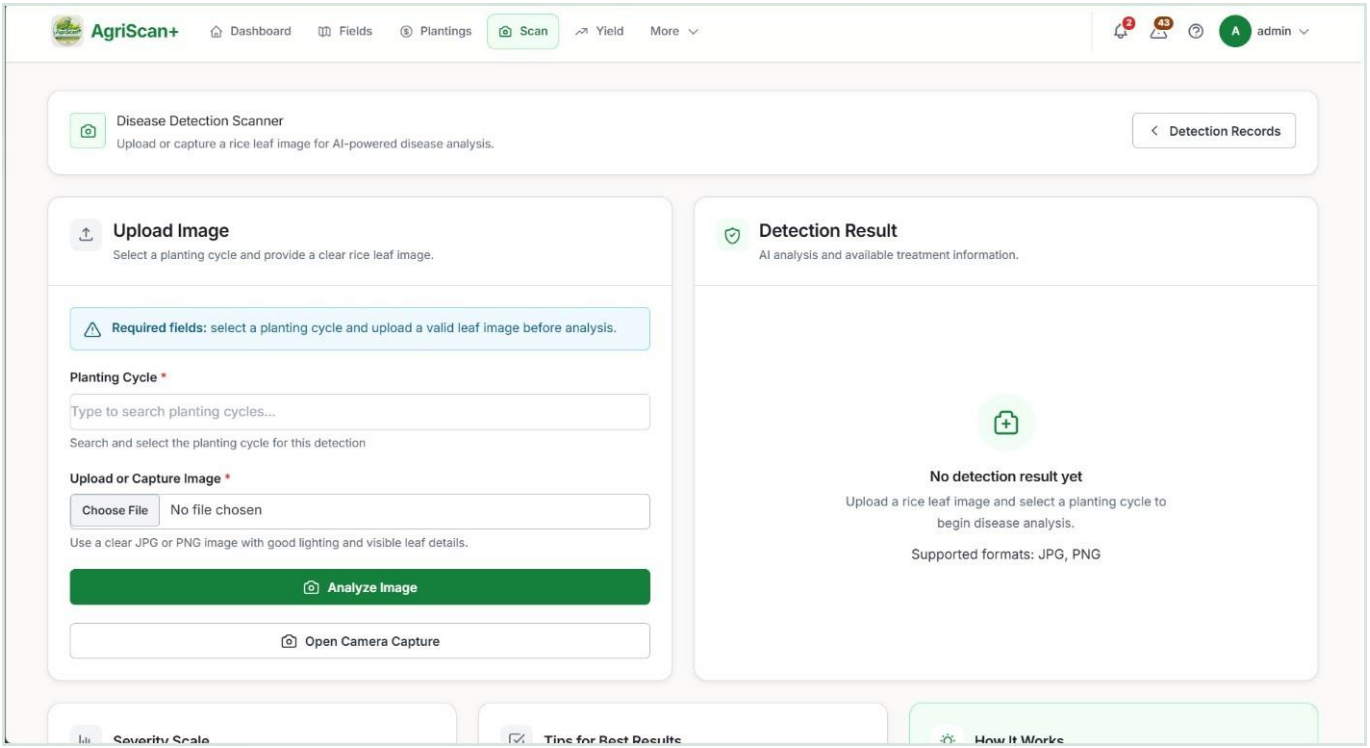

Create a Field first, then add a Planting. Use Scan or Yield Prediction during the active cycle, and record the actual Harvest after harvesting.

04 / CROP ANALYSIS

Detection & Yield

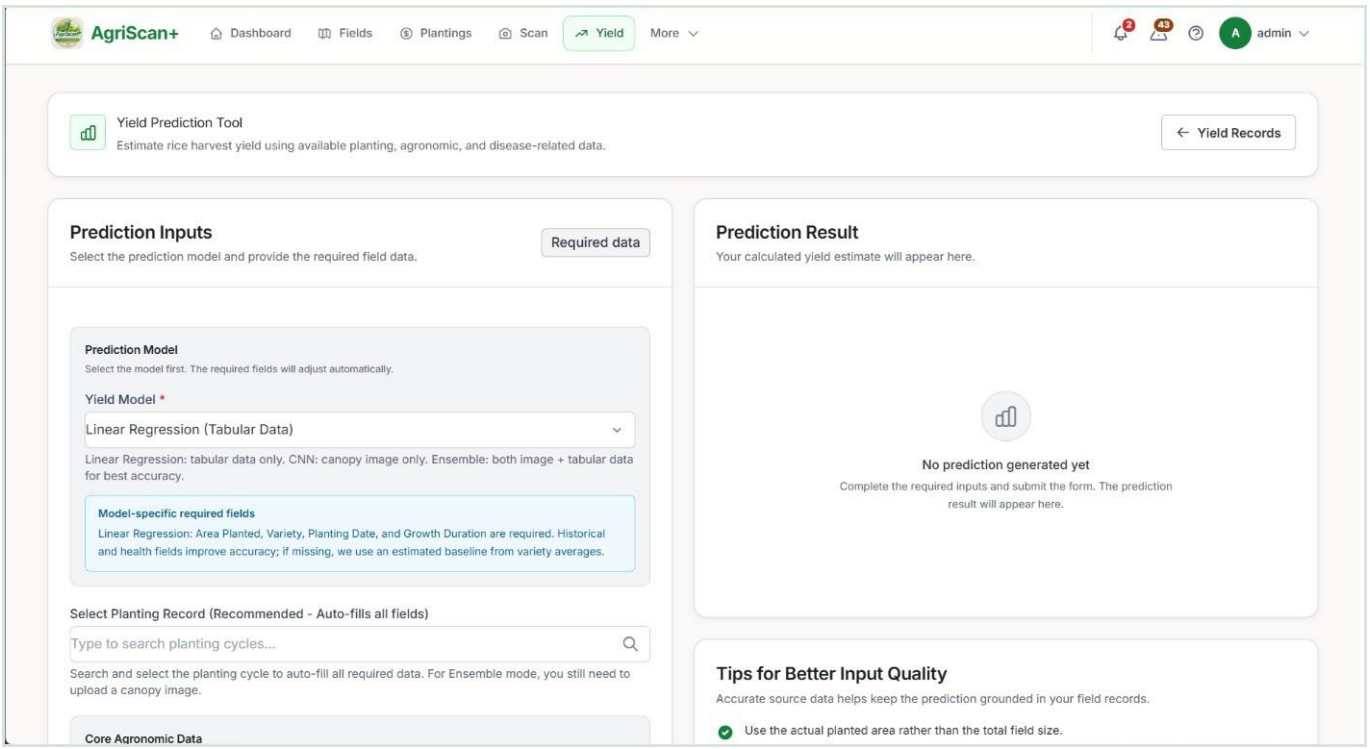

04 Disease Detection Scanner

Select an active planting, upload or capture a clear rice-leaf photo, then analyze it and review the result.

05 Yield Prediction

Choose Linear Regression for farm data, CNN Yield for a canopy photo plus data, or Ensemble for both. Results are estimates only.

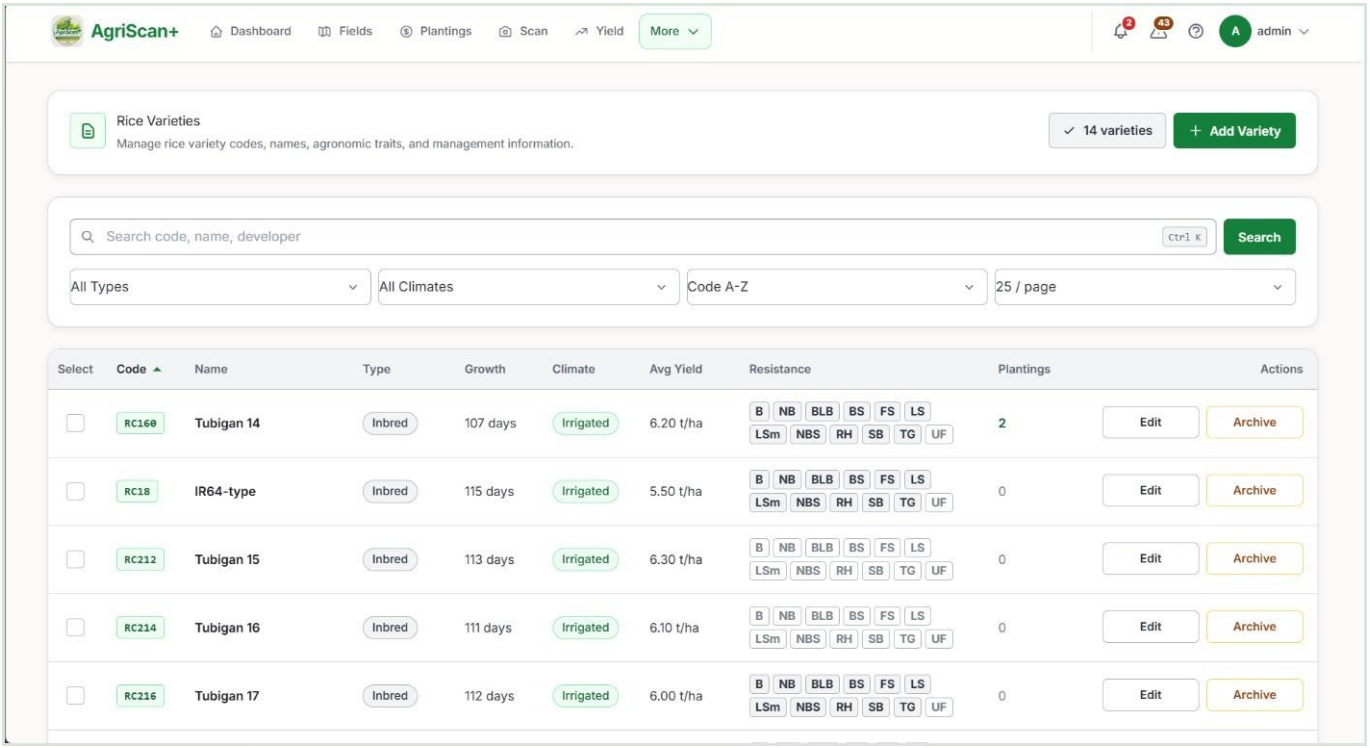

05 / FARM DATA

Varieties & Season Activities

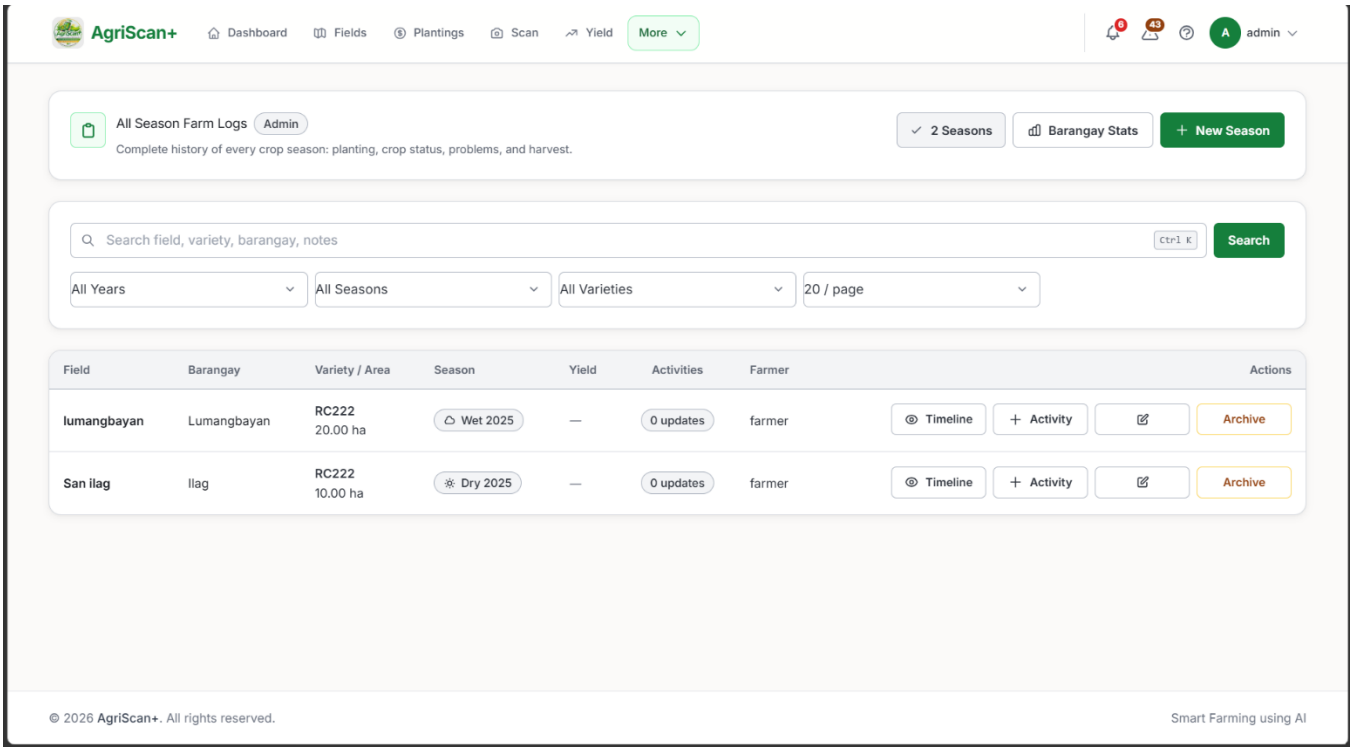

06 Rice Varieties

Review rice-variety details such as growth duration, climate suitability, average yield, and resistance to support planting decisions.

07 Farm Logs / Season Activities

Record seasonal activities such as land preparation, transplanting, fertilizer use, irrigation, pest control, and observations.

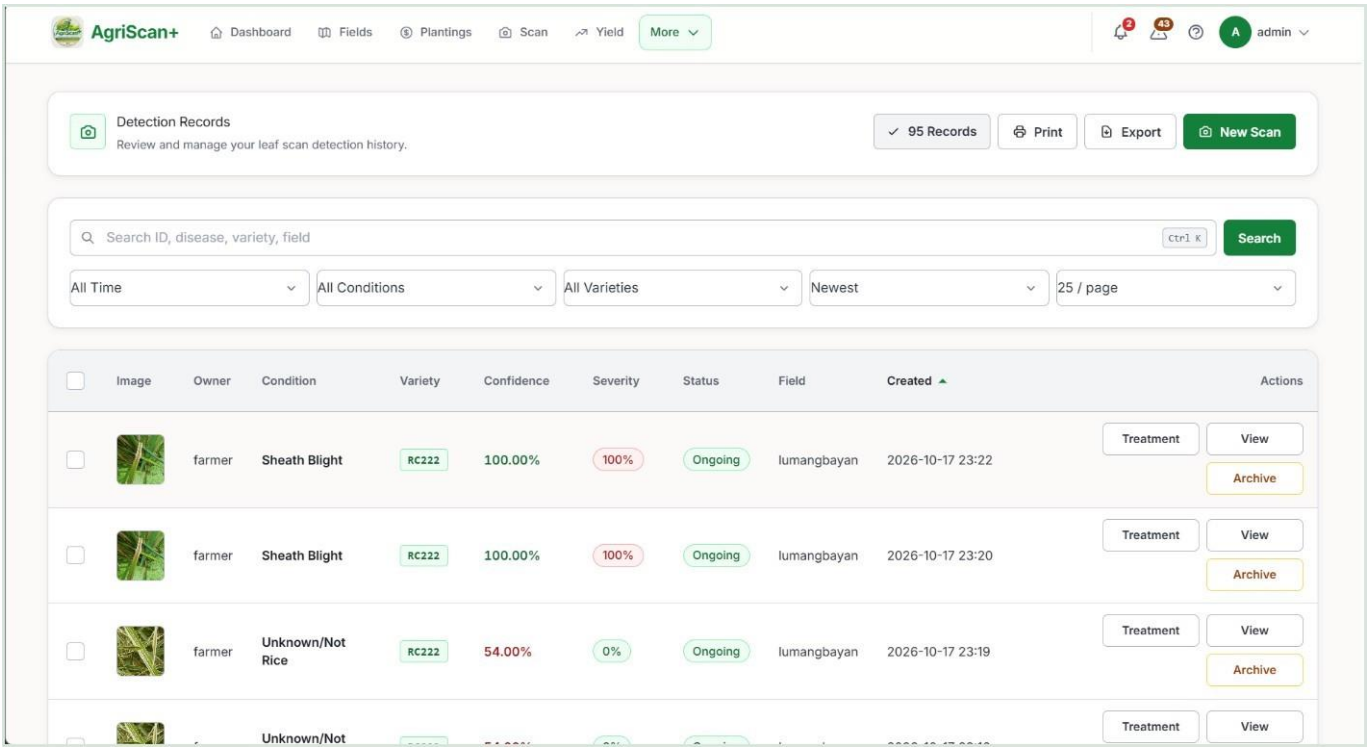

06 / RECORDS

Detection & Yield Records

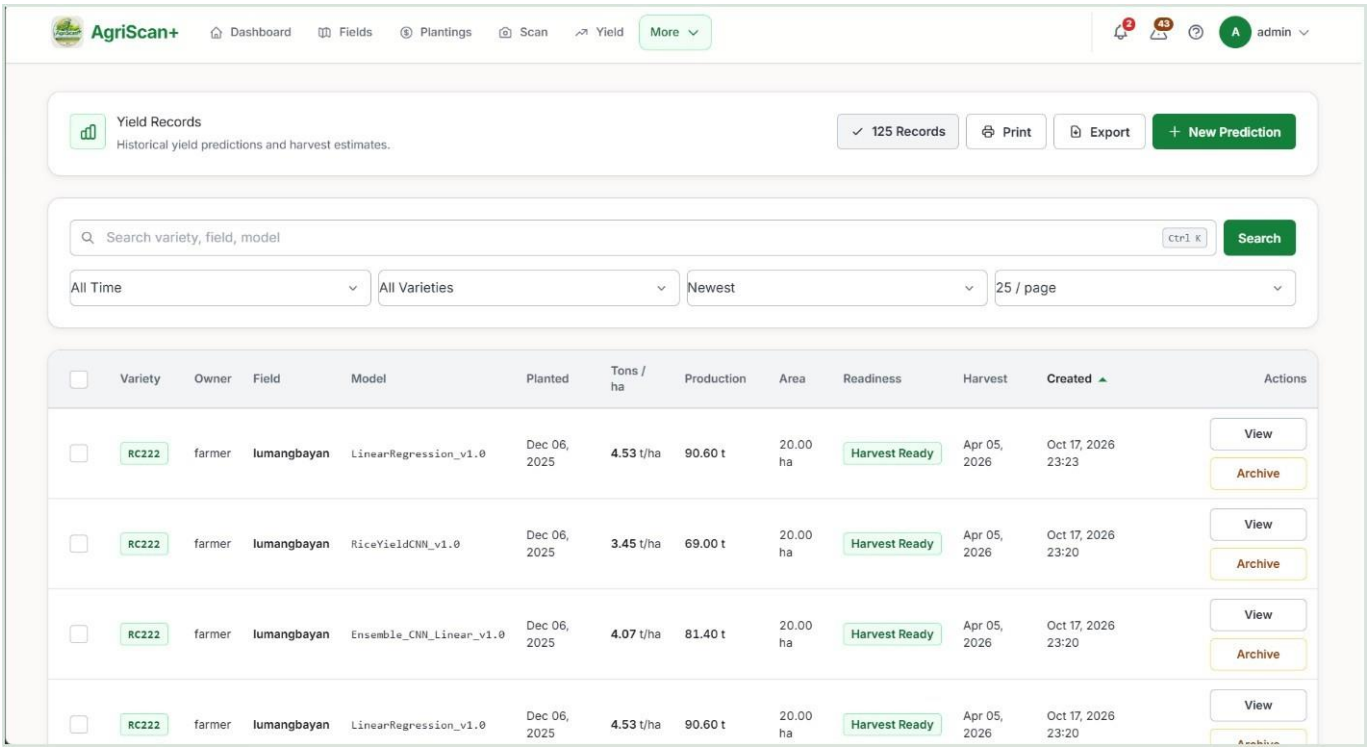

08 Detection Records

Review scan history, disease label, confidence, severity, linked treatment guidance, and related records. Low-confidence results may show Unknown or Not Rice.

09 Yield Records

Review saved yield estimates and compare records when needed. Predictions stay separate from verified harvest totals.

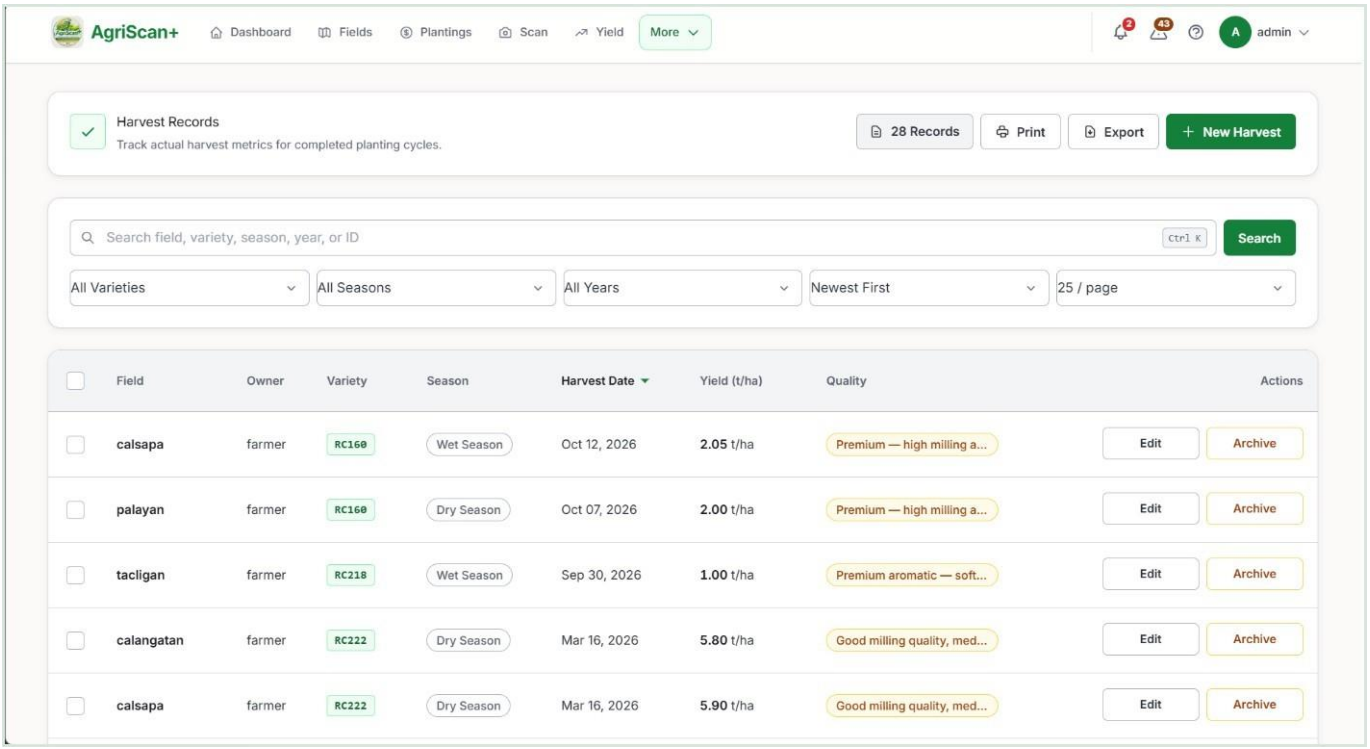

07 / HARVEST & KNOWLEDGE

Harvest & Farming Guidance

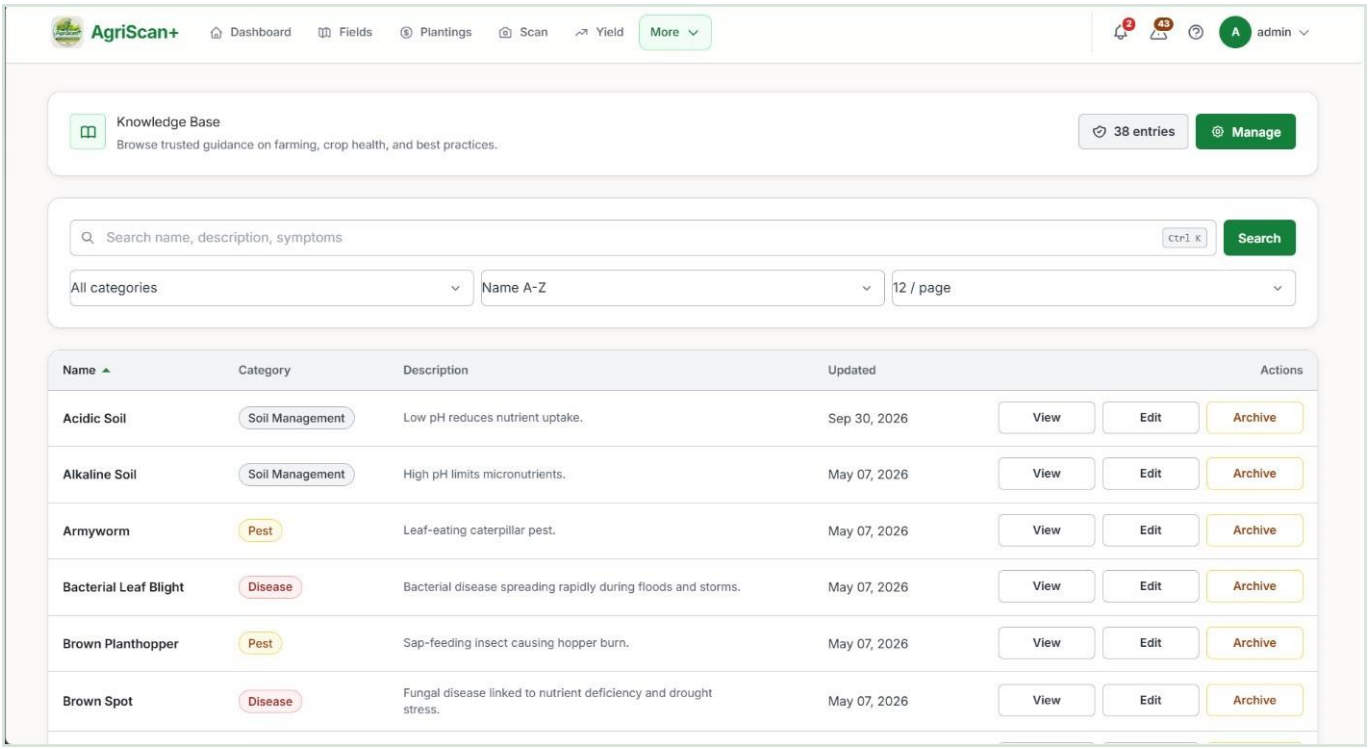

10 Harvest Records

Enter the planting cycle, harvested area, actual production, and date. Harvest entries—not predictions—are the verified production source.

11 Knowledge Base

Read articles on rice diseases, pests, and nutrient deficiencies. Consult an agricultural technician when a case is severe or unclear.

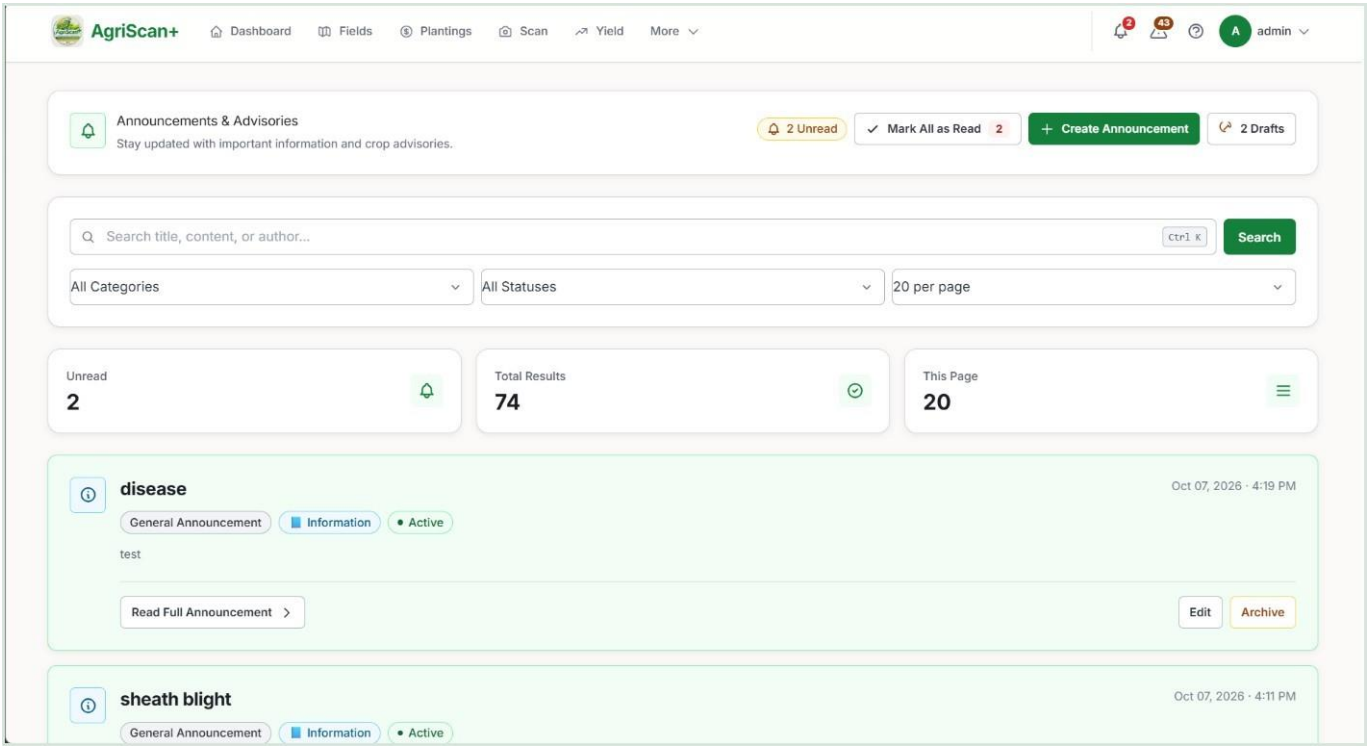

08 / NOTICES

Announcements & Notifications

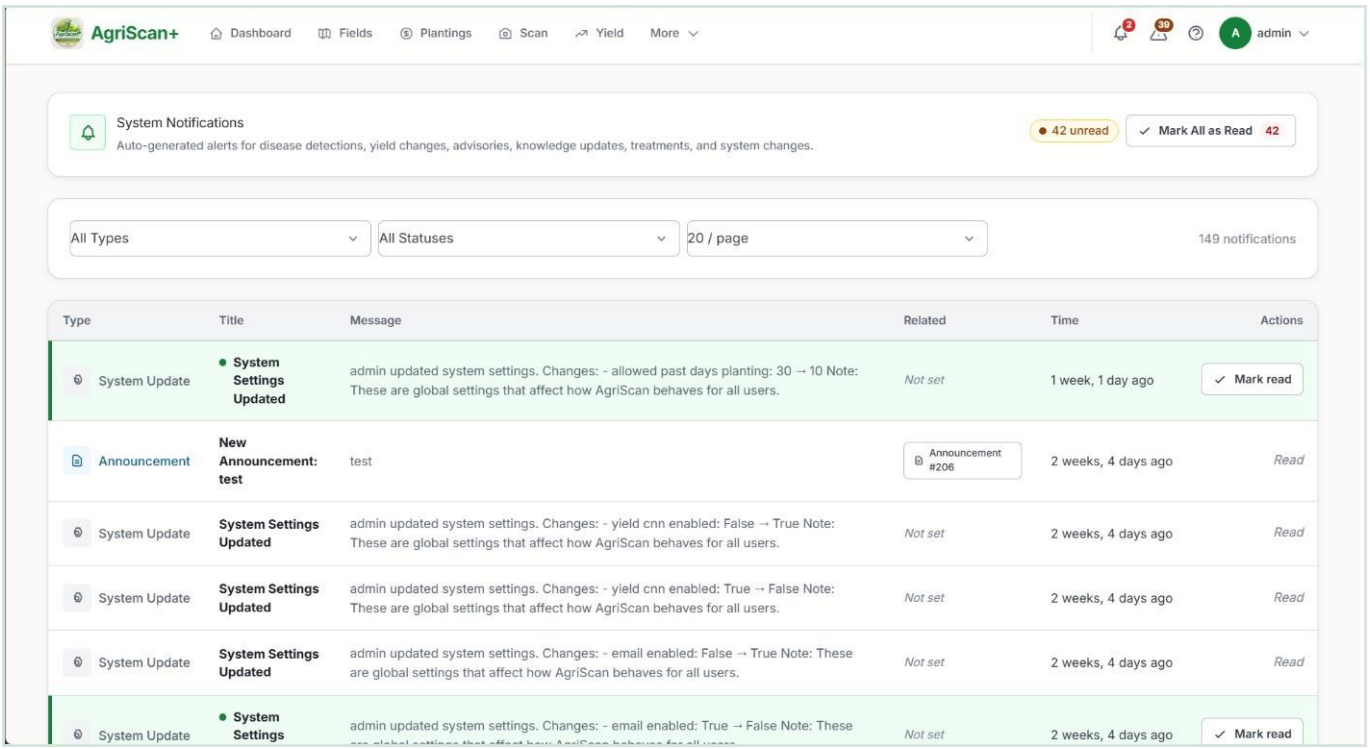

12 Announcements & Advisories

Read advisories targeted to your role and open each announcement for full details.

13 System Notifications

Review alerts about detections, yield updates, system changes, and account activity. Mark individual or all notifications as read.

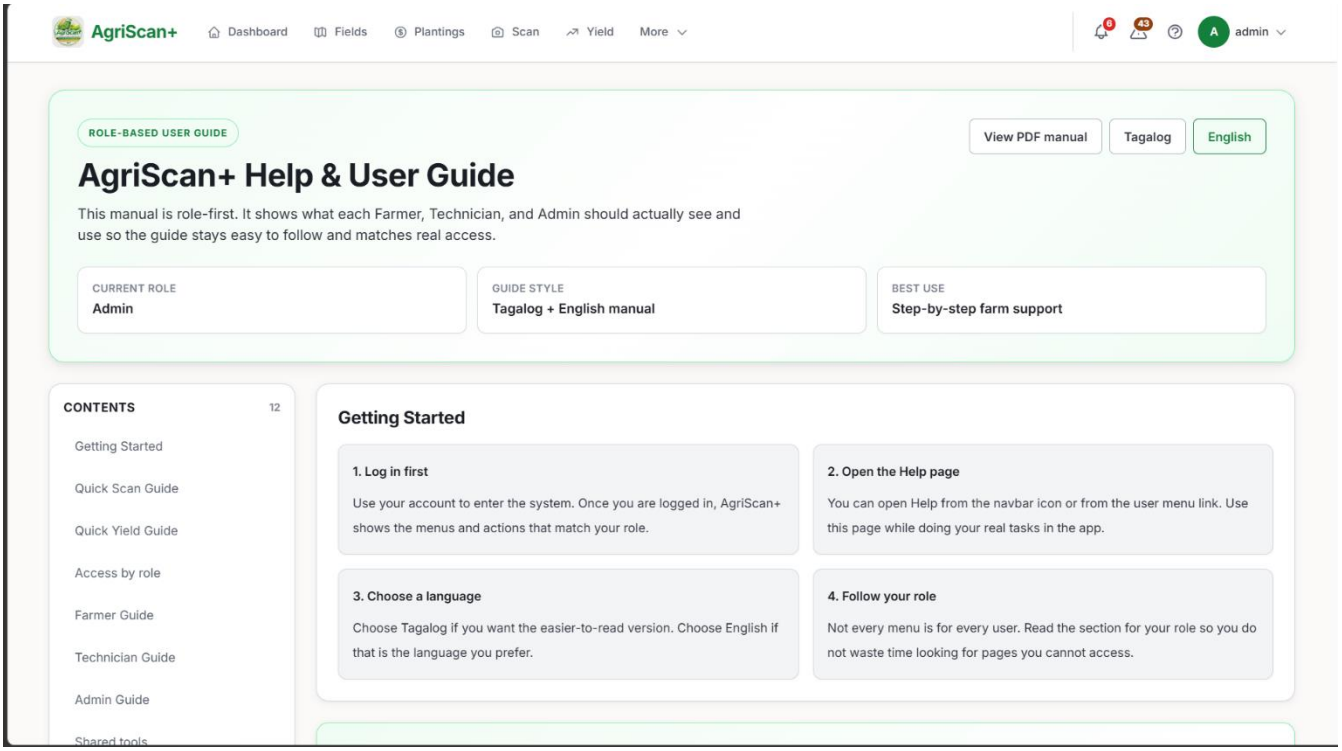

09 / ACCOUNT TOOLS

Help & Profile

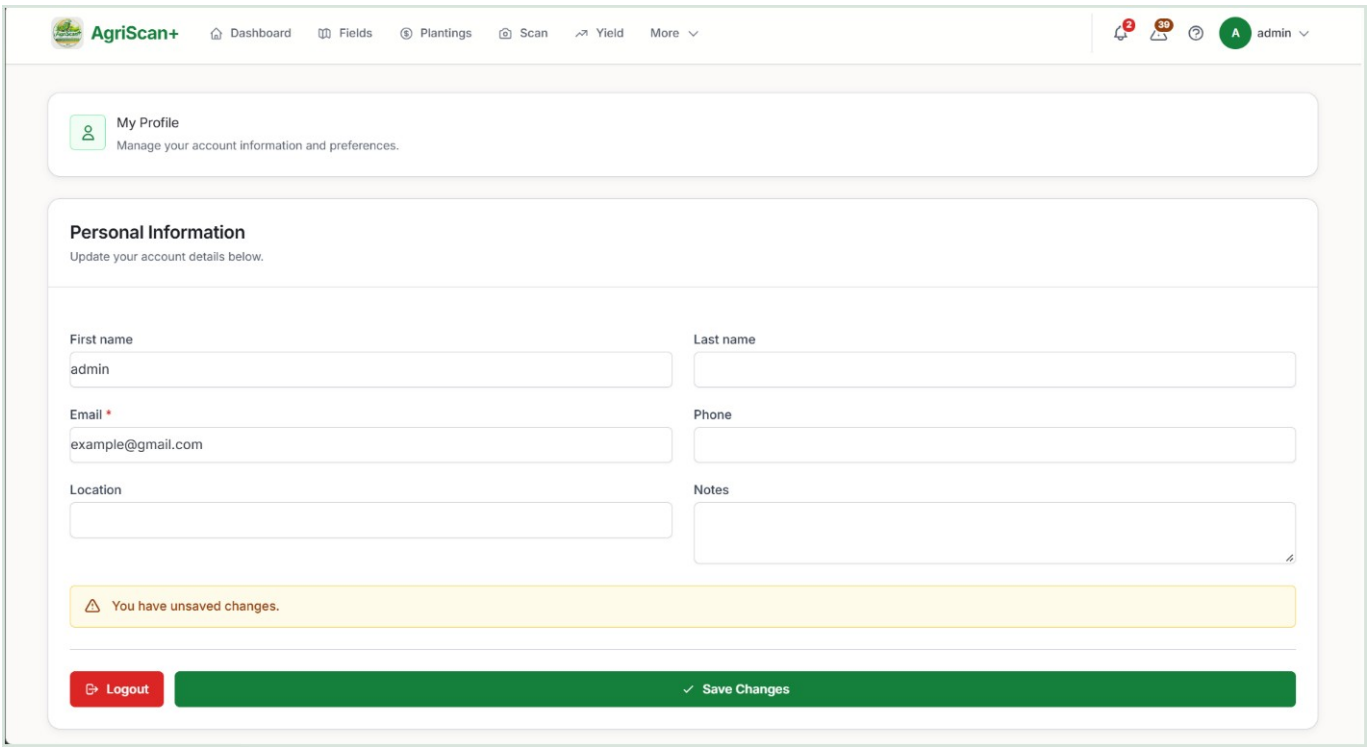

14 Help & User Guide

Choose instructions for your role and use the Quick Scan Guide or Quick Yield Guide for the AI tools.

15 My Profile

Review profile details and update contact information where allowed. Log out after using a shared device.

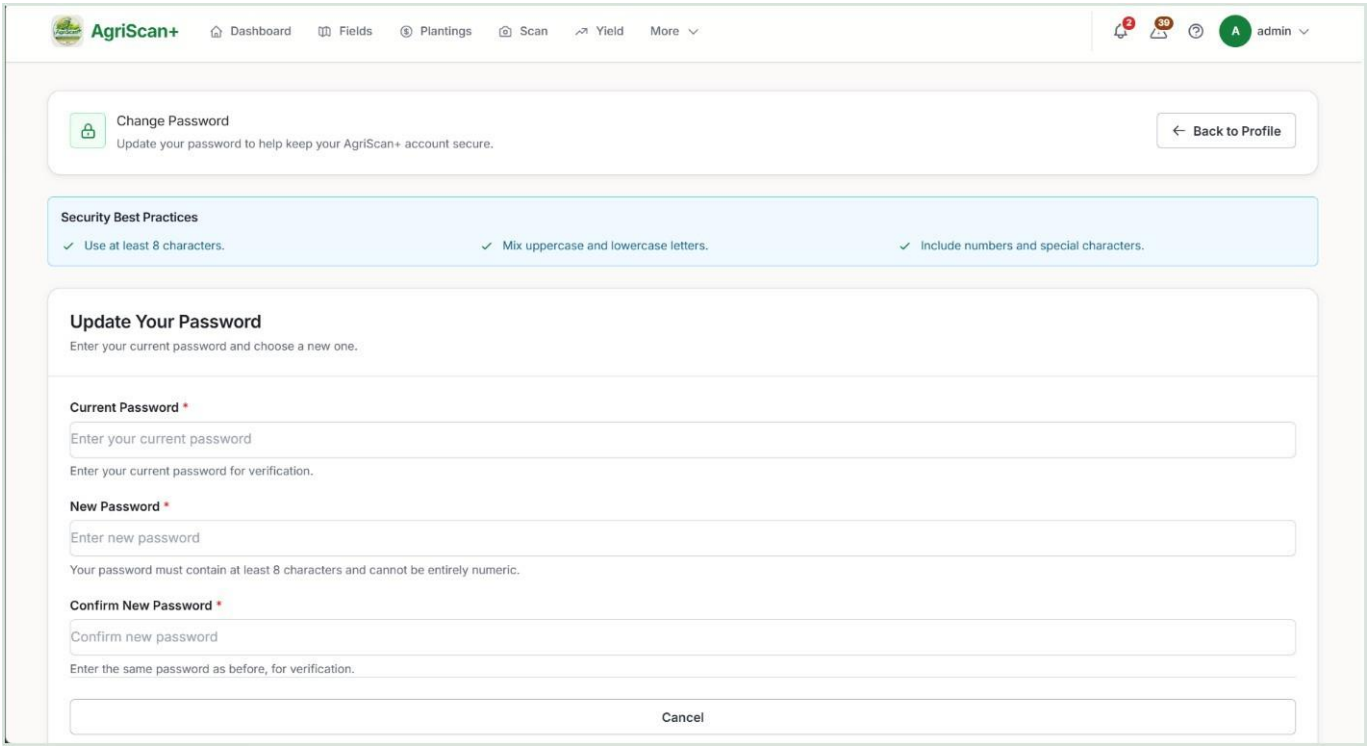

10 / SECURITY & INSIGHTS

Password & Analytics

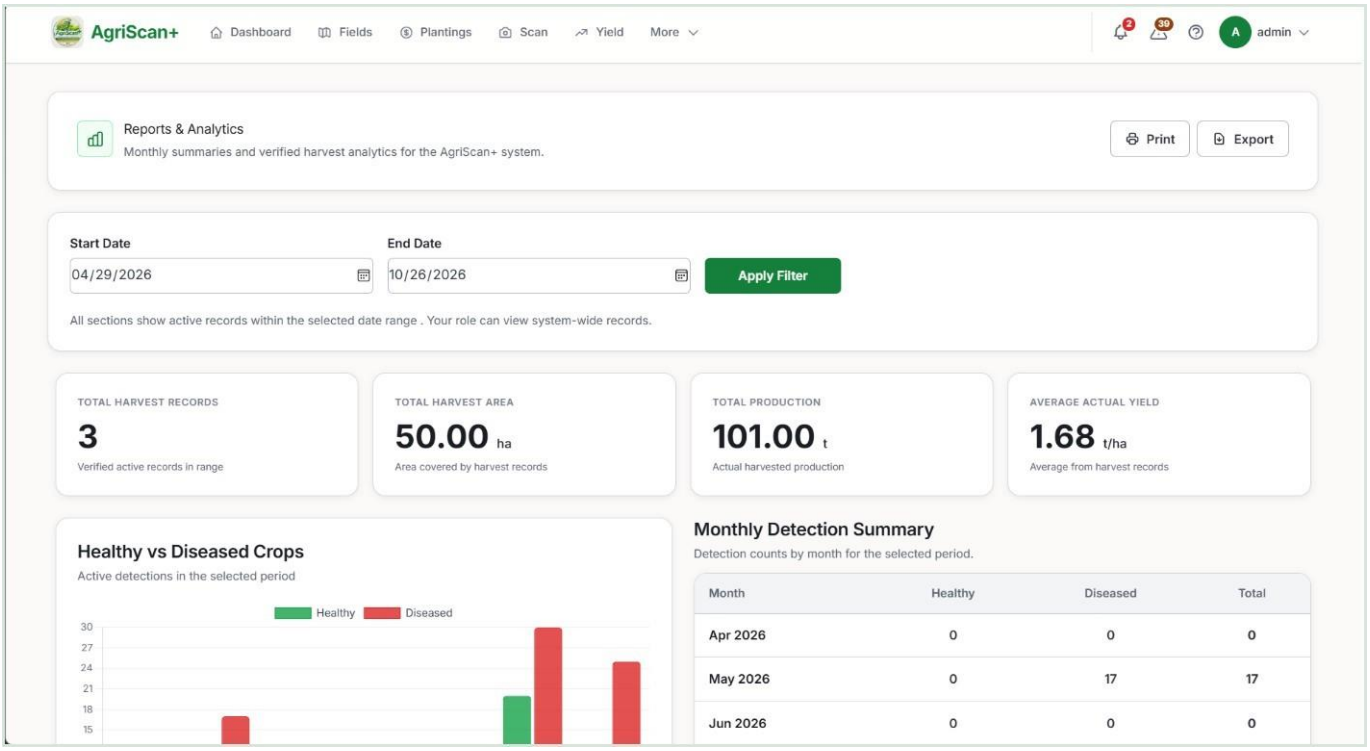

16 Change Password

Enter the current password and confirm the new password carefully before saving the change.

17 Reports & Analytics

Filter by date and, where permitted, barangay. Production totals use actual harvest records, not yield predictions; export reports to CSV or PDF.

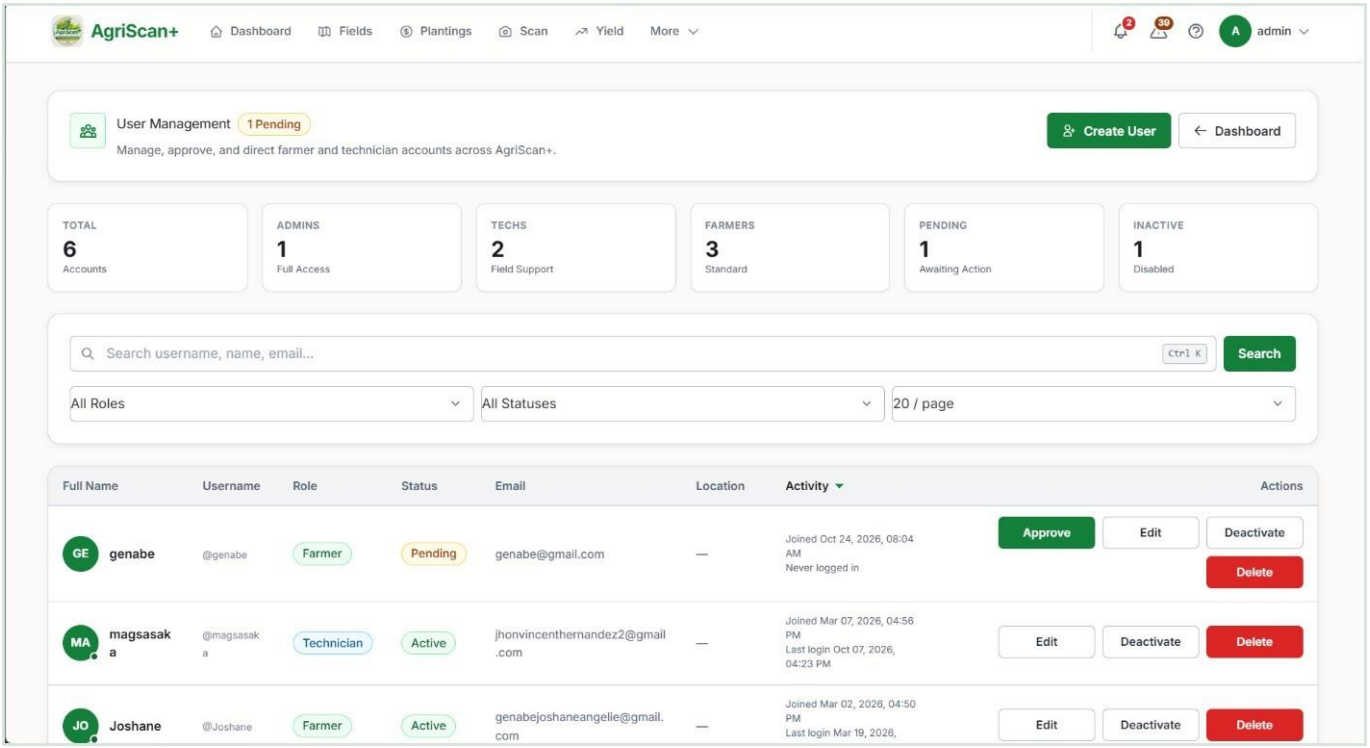

11 / ADMINISTRATION

User Management & Settings

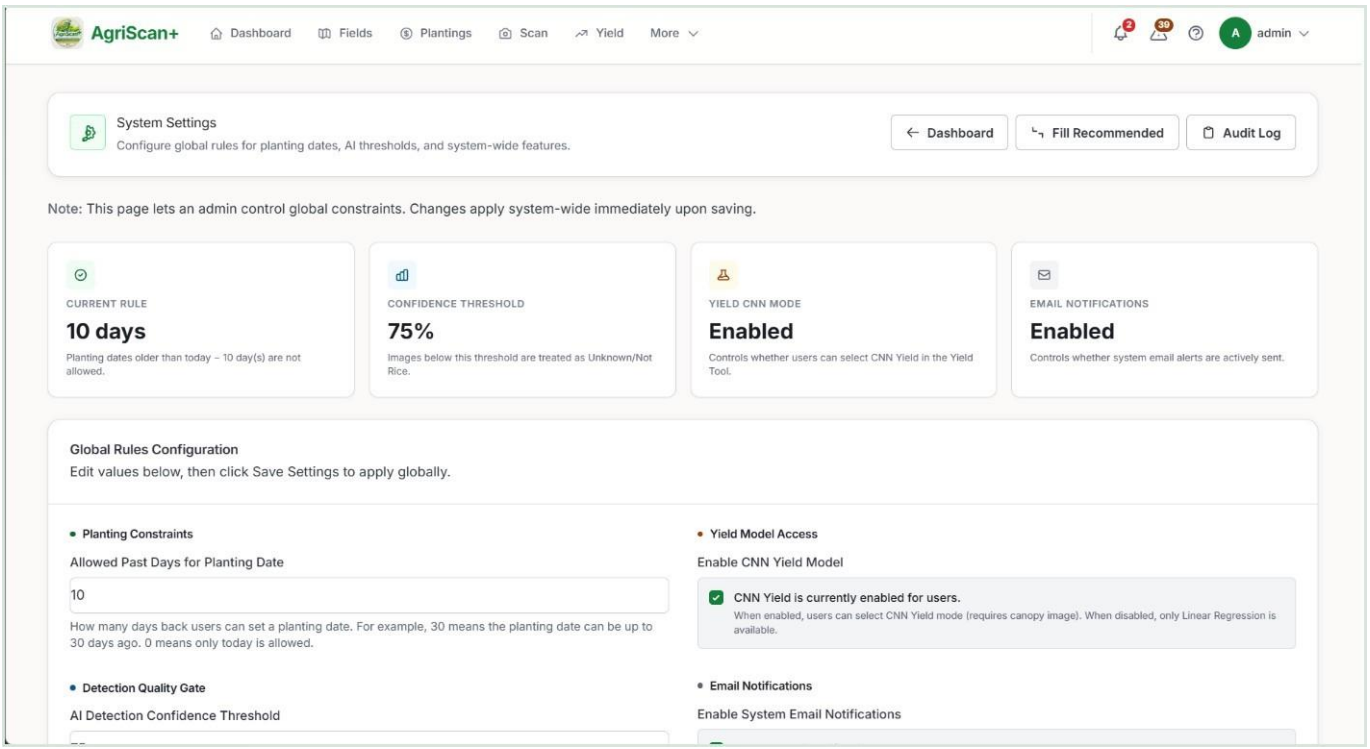

18 User Management

Admins can approve registrations, assign roles, and activate or deactivate accounts. Available actions depend on permissions.

19 System Settings

Admins can configure allowed planting dates, detection confidence threshold, email notifications, and CNN yield availability.

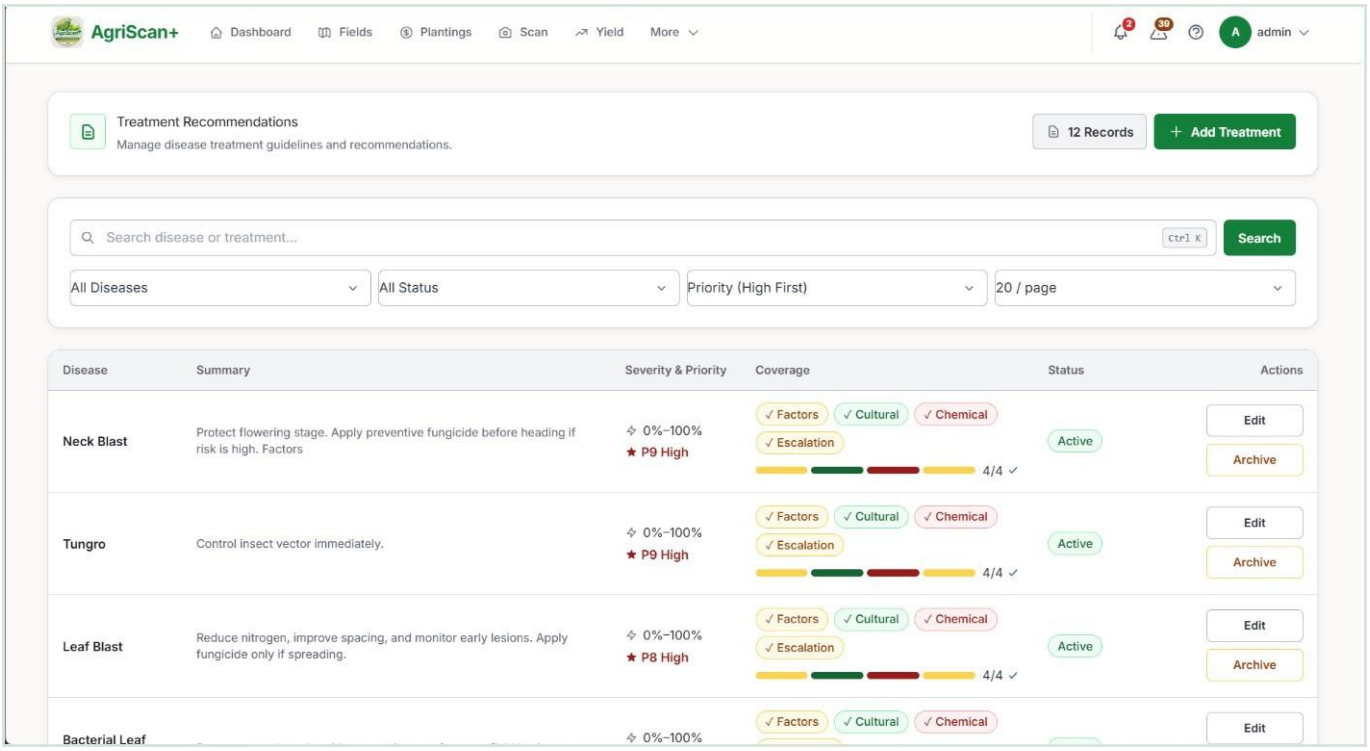

12 / TREATMENT & ARCHIVE

Recommendations & Archived Records

20 Treatment Recommendations

Technicians and admins maintain disease-treatment guidance. Review severity-based recommendations and confirm advice with field expertise when needed.

21 Trash & Archive

Review archived records and restore them when appropriate. Permanent deletion cannot be undone, so use it carefully.
